Introduction

The penguin dataset is a dataset that contains information about the penguins in the Palmer Archipelago, Antarctica. The dataset contains 344 rows and 8 columns. The columns are: species, island, bill_length_mm, bill_depth_mm, flipper_length_mm, body_mass

Note that all the experiments are done on 0.01 Learning Rate and 100 Epochs using bias

Body Mass and Gender

Conclusion

As we can see from the results, the Adelie and Gentoo penguins are very easy to distinguish. The Adelie penguins are smaller than the Gentoo penguins. The Adelie penguins have a smaller bill length and depth than the Gentoo penguins. The Adelie penguins have a smaller body mass than the Gentoo penguins. The Adelie penguins have a smaller flipper length than the Gentoo penguins. The Adelie penguins.

Flipper Length and Gender

Body Mass and Gender

Conclusion

Adelle and Chinstrap penguins are hard to classify in most cases, but the features bill length and bill depth, bill length and gender were the best features to classify with.

Conclusion

Gentoo and Chinstrap penguins are easier to classify than Adelie and Chinstrap, the features gender, bill depth and body_mass were the best features to classify with.

Overall Conclusion

Overall, Adelie and Chinstrap are the hardest to classify, Adelie and Gentoo are the easiest to classify. The best features to classify with are bill length and bill depth.
